

#### The cin Object

· Standard input object

- Like cout, requires iostream file
- Used to read input from keyboard
- Information retrieved from cin with >>
- Input is stored in one or more variables

#### The cin Object

• cin converts data to the type that matches the variable:

int height; cout << "How tall is the room? "; cin >> height;

Copyright © 2012 Pearson Education, Inc.

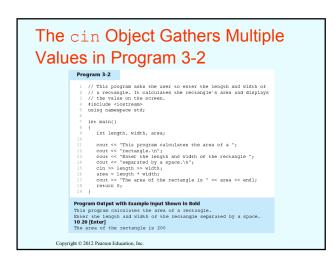

#### **Displaying a Prompt**

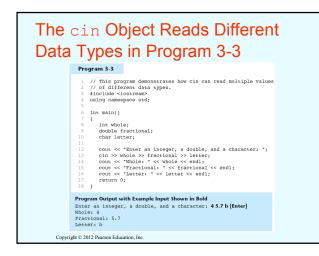

- A prompt is a message that instructs the user to enter data.
- You should always use cout to display a prompt before each cin statement.

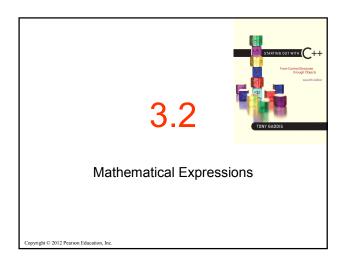

cout << "How tall is the room? "; cin >> height;

#### The cin Object

- Can be used to input more than one value: cin >> height >> width;
- Multiple values from keyboard must be separated by spaces
- Order is important: first value entered goes to first variable, etc.

### Mathematical Expressions

- Can create complex expressions using multiple mathematical operators
- An expression can be a literal, a variable, or a mathematical combination of constants and variables
- Can be used in assignment, cout, other statements:

```
area = 2 * PI * radius;
cout << "border is: " << 2*(l+w);</pre>
```

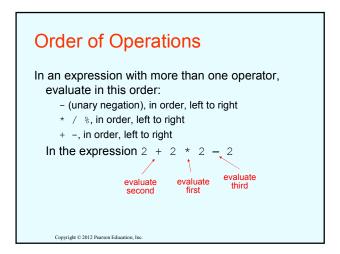

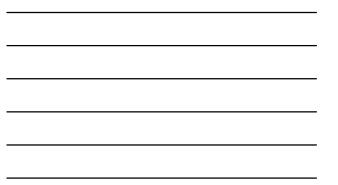

Table 3-2 Some Simple Expre	ssions and Their Value
Expression	Value
5 + 2 * 4	13
10 / 2 - 3	2
8 + 12 * 2 - 4	28
4 + 17 % 2 - 1	4
6 - 3 * 2 + 7 - 1	6

#### Associativity of Operators

- - (unary negation) associates right to left
- \*, /, %, +, associate right to left
- parentheses () can be used to override the order of operations:
  2 + 2 \* 2 2 = 4
  - (2 + 2) \* 2 2 = 6
  - 2 + 2 \* (2 2) = 2(2 + 2) \* (2 - 2) = 0

# **Grouping with ParenthesesTable 3-4 More Simple Expressions and Their Values** $\underline{\text{Expression}}$ $\underline{\text{Value}}$ (5+2)\*42810 / (5-3)58+12\*(6-2)56(4+17) & 2-10(6-3)\*(2+7) / 39

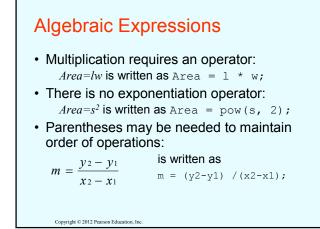

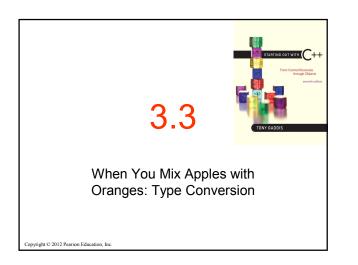

Table 3-5 Algebraic and C+	+ Multiplication Expressions	
Algebraic Expression	Operation	C++ Equivalent
6B	6 times B	6 * B
(3)(12)	3 times 12	3 * 12
4xy	4 times x times y	4 * x * y

## When You Mix Apples with Oranges: Type Conversion

- Operations are performed between operands of the same type.
- If not of the same type, C++ will convert one to be the type of the other
- This can impact the results of calculations.

Copyright © 2012 Pearson Education, Inc.

#### **Hierarchy of Types**

Highest: long double double float unsigned long long unsigned int Lowest: int Ranked by largest number they can hold

Copyright © 2012 Pearson Education, Inc.

#### **Type Coercion**

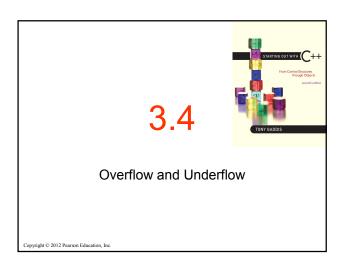

- <u>Type Coercion</u>: automatic conversion of an operand to another data type
- Promotion: convert to a higher type
- <u>Demotion</u>: convert to a lower type

```
Copyright © 2012 Pearson Education, Inc
```

#### **Coercion Rules**

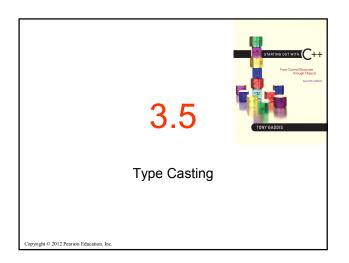

Copyright © 2012 Pearson Education, Inc.

- char, short, unsigned short automatically promoted to int
- 2) When operating on values of different data types, the lower one is promoted to the type of the higher one.
- When using the = operator, the type of expression on right will be converted to type of variable on left

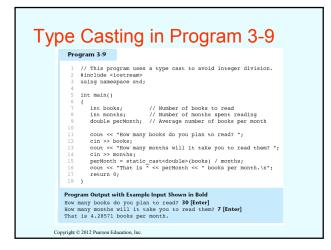

#### Overflow and Underflow

- Occurs when assigning a value that is too large (overflow) or too small (underflow) to be held in a variable
- Variable contains value that is 'wrapped around' set of possible values
- Different systems may display a warning/error message, stop the program, or continue execution using the incorrect value

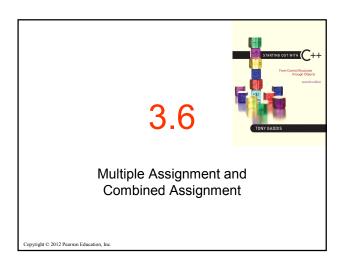

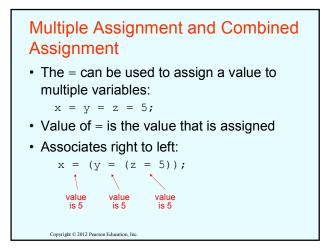

#### 

- C-Style cast: data type name in () cout << ch << " is " << (int)ch;
- Prestandard C++ cast: value in ()
   cout << ch << " is " << int(ch);</pre>
- Both are still supported in C++, although static cast is preferred

#### **Combined Assignment**

• Look at the following statement:

sum = sum + 1;

Copyright © 2012 Pearson Education, Inc.

This adds 1 to the variable **sum**.

Statement	What It Does	Value of x After the Stateme
x = x + 4;	Adds 4 to x	10
x = x - 3;	Subtracts 3 from x	3
x = x * 10;	Multiplies x by 10	60
x = x / 2;	Divides x by 2	3
x = x % 4	Makes x the remainder of x / 4	2

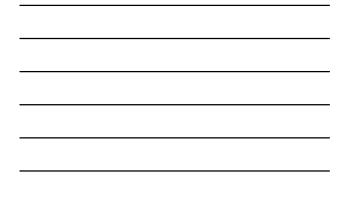

#### **Combined Assignment**

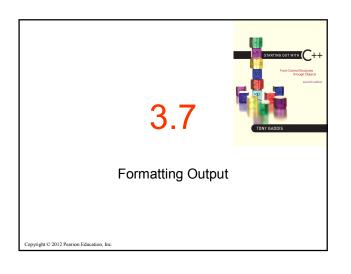

• The combined assignment operators provide a shorthand for these types of statements.

• The statement sum = sum + 1;

is equivalent to
 sum += 1;

x += 5;           -=         y -= 2;	Equivalent to
-= y -= 2;	
	x = x + 5;
	y = y - 2;
*= z *= 10;	z = z * 10
/= a /= b;	a = a / b;
%= c %= 3;	c = c % 3;
δ= c %= 3;	c = c % 3

## Formatting Output

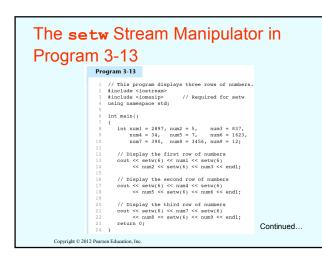

- Can control how output displays for numeric, string data:
  - size
  - position
  - number of digits

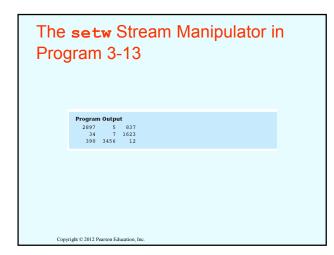

Copyright © 2012 Pearson Education, Inc.

• Requires iomanip header file

## Stream Manipulators

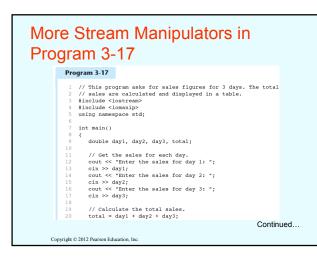

- Used to control how an output field is displayed
- Some affect just the next value displayed:
   setw(x): print in a field at least x spaces wide. Use more spaces if field is not wide enough

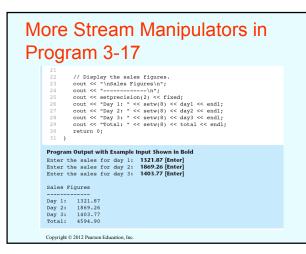

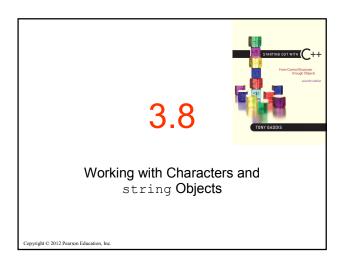

#### **Stream Manipulators**

- Some affect values until changed again:
  - fixed: use decimal notation for floating-point values
  - setprecision (x): when used with fixed, print floating-point value using x digits after the decimal. Without fixed, print floatingpoint value using x significant digits
  - showpoint: always print decimal for floatingpoint values

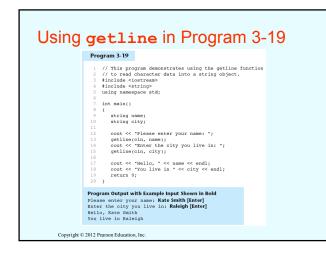

Stream Manipulator	Description
setw(n)	Establishes a print field of $n$ spaces.
fixed	Displays floating-point numbers in fixed point notation.
showpoint	Causes a decimal point and trailing zeroes to be displayed, even i there is no fractional part.
setprecision(n)	Sets the precision of floating-point numbers.
left	Causes subsequent output to be left justified.
right	Causes subsequent output to be right justified.

## Working with Characters and string Objects

- Using cin with the >> operator to input strings can cause problems:
- It passes over and ignores any leading whitespace characters (spaces, tabs, or line breaks)
- To work around this problem, you can use a C++ function named getline.

## Working with Characters and string Objects

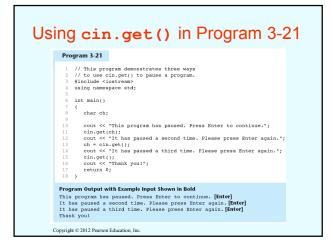

#### • To read a single character:

- Use cin: char ch; cout << "Strike any key to continue"; cin >> ch; Problem: will skip over blanks, tabs, <CR>

- Use cin.get():

cin.get(ch);

Will read the next character entered, even whitespace

## Working with Characters and string Objects

- Mixing cin >> and cin.get() in the same program can cause input errors that are hard to detect
- To skip over unneeded characters that are still in the keyboard buffer, use cin.ignore():

Copyright © 2012 Pearson Education, Inc.

# string Member Functions and Operators

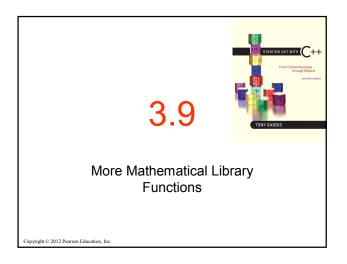

• To find the length of a string:

string state = "Texas"; int size = state.length();

• To concatenate (join) multiple strings:

greeting2 = greeting1 + name1; greeting1 = greeting1 + name2;

Or using the += combined assignment operator: greeting1 += name2;

More Mathematical Library	
Functions	

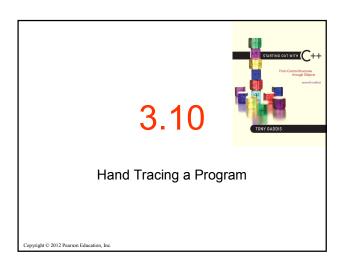

- Require cmath header file
- Take double as input, return a double
- Commonly used functions:

sin	Sine
cos	Cosine
tan	Tangent
sqrt	Square root
log	Natural (e) log
abs	Absolute value (takes and returns an int)

Copyright © 2012 Pearson Education, Inc.

# More Mathematical Library Functions

- These require cstdlib header file
- rand(): returns a random number (int) between 0 and the largest int the compute holds. Yields same sequence of numbers each time program is run.
- srand(x): initializes random number generator with unsigned int x

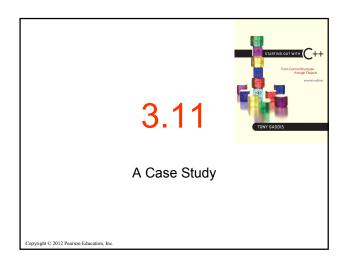

#### Hand Tracing a Program

- Hand trace a program: act as if you are the computer, executing a program:
  - step through and 'execute' each statement, one-by-one
  - record the contents of variables after statement execution, using a hand trace chart (table)
- Useful to locate logic or mathematical errors

Copyright © 2012 Pearson Education, Inc.

Program 3-26 with Hand Trace Chart Program 3-26 (with hand trace chart filled) // This program asks for three numbers, then 2 // displays the average of the numbers. 3 #include <lostream> 4 using namespace std; 5 int main() 6 ( avo ? ? ? 7 double num1, num2, num3, avg; ? ? 8 cout << "Enter the first number: ";</p> 1 1 9 cin >> num1; 10 1 10 cout << "Enter the second number: "; 10 1 11 cin >> num2; 10 20 ? 10 12 cout << "Enter the third number: ": 20 13 cin >> num3; 10 20 30 30 14 avg = num1 + num2 + num3 / 3; 10 20 40 15 cout << "The average is " << avg << endl;</pre> 10 20 30 16 return 0; 17 ) Copyright © 2012 Pearson Education, Inc.

#### A Case Study

- General Crates, Inc. builds customdesigned wooden crates.
- You have been asked to write a program that calculates the:
  - Volume (in cubic feet)
  - Cost
  - Customer price
  - Profit of any crate GCI builds

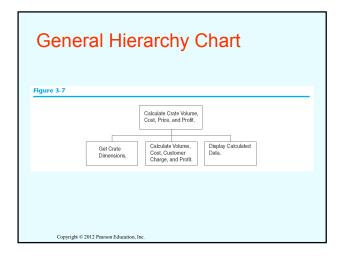

Copyright © 2012 Pearson Education, Inc.

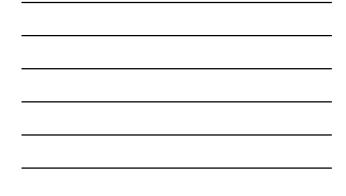

#### Variables

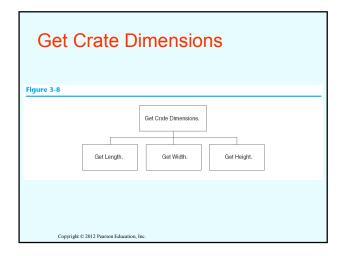

Constant or Variable	Description
COST_PER_CUBIC_FOOT	A named constant, declared as a double and initialized with the value 0.23. This represents the cost to build a crate, per cubic foot.
CHARGE_PER_CUBIC_FOOT	A named constant, declared as a double and initialized with the value 0.5. This represents the amount charged for a crate, per cubic foot.
length	A double variable to hold the length of the crate, which is input by the user.
width	A double variable to hold the width of the crate, which is input by the user.
height	A double variable to hold the height of the crate, which is input by the user.
volume	A double variable to hold the volume of the crate. The value stored in this variable is calculated.
cost	A double variable to hold the cost of building the crate. The value stored in this variable is calculated.
charge	A double variable to hold the amount charged to the customer for the crate. The value stored in this variable is calculated.
profit	A double variable to hold the profit GCI makes from the crate. The value stored in this variable is calculated.

Copyright © 2012 Pearson Education, Inc.

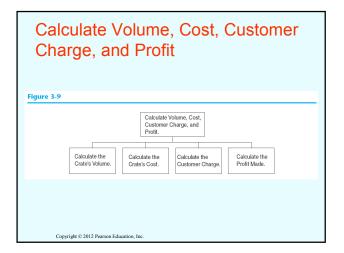

#### Program Design The program must perform the following general steps: Step 1: Ask the user to enter the dimensions of the crate Step 2: Calculate: the crate's volume the cost of building the crate the customer's charge the profit made Step 3: Display the data calculated in Step 2.

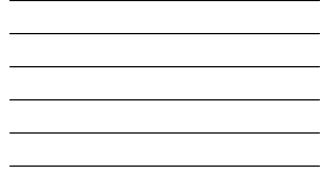

Display Calculated Data
Figure 3-10
Display Calculated Data.
Copyright © 2012 Pearson Education, Inc.

#### Psuedocode

Ask the user to input the crate's length. Ask the user to input the crate's width. Ask the user to input the crate's height. Calculate the crate's volume. Calculate the cost of building the crate. Calculate the customer's charge for the crate. Display the crate's volume. Display the cost of building the crate. Display the customer's charge for the crate. Display the customer's charge for the crate. Display the profit made from the crate.

Copyright © 2012 Pearson Education, Inc.

#### Calculations

The following formulas will be used to calculate the crate's volume, cost, charge, and profit:

volume = length × width × height

cost = volume × 0.23

charge = volume × 0.5

profit = charge - cost

The Program	
Program 3-27	
<pre>2 // the volume, cost, cust 3 // of any size. It calcul 4 // consists of the dimens 5 #include  6 #include  7 using namespace std; 8 9 int main() 10 { 11 // Constants for cost 12 const double COST FER. 12 const double COST FER.</pre>	and amount charged UBIC_FOOT = 0.23;
13 const double CHARGE_PE	R_CUBIC_FOOT = 0.5;
17 width, // Th 18 height, // Th 19 volume, // Th 20 cost, // Th 21 charge, // Th 22 profit; // Th 23 // Set the desired out	e crate's length e crate's width e crate's height wolume of the crate e coat to build the crate e customer charge for the crate e profit made on the crate profit formuthers. of tixed << showpoint; Continued
